

STEPS TO CREATE A REST API

Symfony Project

- STEP 1:** To create a symfony project, use the below command:
composer create-project symfony/skeleton:"7.2.*" APIProject --no-security-blocking
- STEP 2:** To change directory of project, cd APIProject
- STEP 3:** composer require webapp

Database ORM

- For creating a database named Product, we have to follow the below steps.
- STEP 4:** composer require symfony/orm-pack
- STEP 5:** composer require --dev symfony/maker-bundle
- STEP 6:** In the .env file, change
DATABASE_URL="mysql://root:@127.0.0.1:3306/Product?serverVersion=8.0.37"
- STEP 7:** php bin/console doctrine:database:create
- STEP 8:** To create an Entity named Pdt, use php bin/console make:entity
- STEP 9:** For migrating the database to our phpmyadmin, use php bin/console make:migration command
- STEP 10:** php bin/console doctrine:migrations:migrate command.
- STEP 11:** To create a new controller named ProductController, use php bin/console make:controller ProductController command.

HTTP Verbs

- STEP 12:** To create AppFixtures folder in our project, use composer require orm-fixtures --dev command.
- STEP 13:** php bin/console doctrine:fixtures:load
- STEP 14:** php bin/console doctrine:query:sql "SELECT * FROM Product "
- STEP 15:** composer require symfony/serializer-pack
- STEP 16:** composer require symfony/validator
- STEP 17:** php bin/console make:listener Exception
